Installing drive encryption, boot up halts
Posted by admin - 30 Jun 2012 18:21

_____

I have a L702X laptop. Was working fine. Then tried to install Check Point drive encryption. Install requires a software download and then reboots to start encrypting drive. When I reboot the boot up process halts at a black screen right after Check Point initializes. Have tried multiple fixes found on Check Point forums. No luck.

Then tried removing drive (SSD) and installed into another L702X. It booted up fine and started encrypting the drive. Put the drive from the working L702X into my laptop and it halted at the same point also. Switched drives back and same problem. The other laptop with it's original drive still works fine.

Any ideas?
